Artificial Intelligence

Chapter 2: Intelligent Agents

Adapted from slides available in Russell & Norvig's textbook webpage

Dr. Ahmedul Kabir

Outline

- Agents and environments
- Rationality
- PEAS (Performance measure, Environment, Actuators, Sensors)
- Environment types
- Agent types

Agents

- An **agent** is anything that can be viewed as **perceiving** its environment through sensors and **acting** upon that environment through actuators

Examples of Agents

- **Human agent:** eyes, ears, and other organs for sensors; hands, legs, mouth, and other body parts for actuators
- **Robotic agent:** cameras and infrared range finders for sensors; various motors for actuators
- **Software agent:** receives keystrokes, file contents, network packets as sensory inputs; acts by displaying on screen, writing files etc.

Vacuum-cleaner world

- **Percepts:** location and contents, e.g., [A, Dirty]
- **Actions:** *Left*, *Right*, *Suck*, *NoOp*

Rational Agent

- A rational agent chooses whichever action maximizes the expected value of the performance measure given the percept sequence to date
- Rational \neq omniscient
 - percepts may not supply all relevant information
- Rational \neq clairvoyant
 - action outcomes may not be as expected
- Hence, rational \neq successful
- Rational \Rightarrow exploration, learning, autonomy

Rational agents

- An agent should strive to "do the right thing", based on what it can perceive and the actions it can perform.
- **Performance measure:** An objective criterion for success of an agent's behavior
- E.g., performance measure of a vacuum-cleaner agent could be :
 - amount of dirt cleaned up
 - amount of time taken
 - amount of electricity consumed

PEAS

- Specifying the task environment:
 - **P**erformance measure
 - **E**nvironment
 - **A**ctuators
 - **S**ensors

PEAS

- Agent: **Part-picking robot**
 - **Performance measure:** % of parts in correct bins
 - **Environment:** Conveyor belt, parts, bins
 - **Actuators:** Jointed arm and hand
 - **Sensors:** Camera, joint angle sensors

PEAS

- Agent: **Automated car**
 - **Performance measure:** Safe, fast, legal, comfortable trip
 - **Environment:** Roads, other traffic, pedestrians
 - **Actuators:** Steering wheel, accelerator, brake
 - **Sensors:** Camera, GPS, Speedometer, engine sensor

Environment types

- Fully observable vs. partially observable
- Single agent vs. multiagent
- Deterministic vs. stochastic
- Episodic vs. sequential
- Static vs dynamic
- Discrete vs continuous

Fully Observable

Agent can observe (see/hear/perceive)
all relevant information from the
environment

Partially Observable

Agent can observe only **partial**
information from the environment

Single Agent

Our agent is the only intelligent agent in the environment

Multiagent

There are multiple intelligent agents which can be either **cooperative** or **competitive**

Deterministic

Agent can **fully determine** the outcome of its action (next step, not necessarily the full task)

Stochastic

Agent is **uncertain** of the outcome of its action

Episodic

Agent's actions are completely **independent** of each other, not linked to past or future actions

Sequential

Agent's actions are **dependent** on its past/future actions. The actions form a **sequence**.

Static

While the agent is in the process of taking its action, the environment **doesn't change**

Dynamic

The environment is **constantly changing** even when the agent is taking an action

Discrete

Agent's task can be broken down into **discrete set of actions** (you can make a list of agent's actions A_1, A_2, \dots, A_n)

Continuous

Actions are happening **continuously** and can not be listed, i.e., you cannot say where one action ends and the other begins

Environment types

	Chess with a clock	Chess without a clock	Taxi driving
Fully observable	Yes	Yes	No
Deterministic	Strategic	Strategic	No
Episodic	No	No	No
Static	Semi	Yes	No
Discrete	Yes	Yes	No
Single agent	No	No	No

- The environment type largely determines the agent design
- The real world is (of course) partially observable, stochastic, sequential, dynamic, continuous, multi-agent

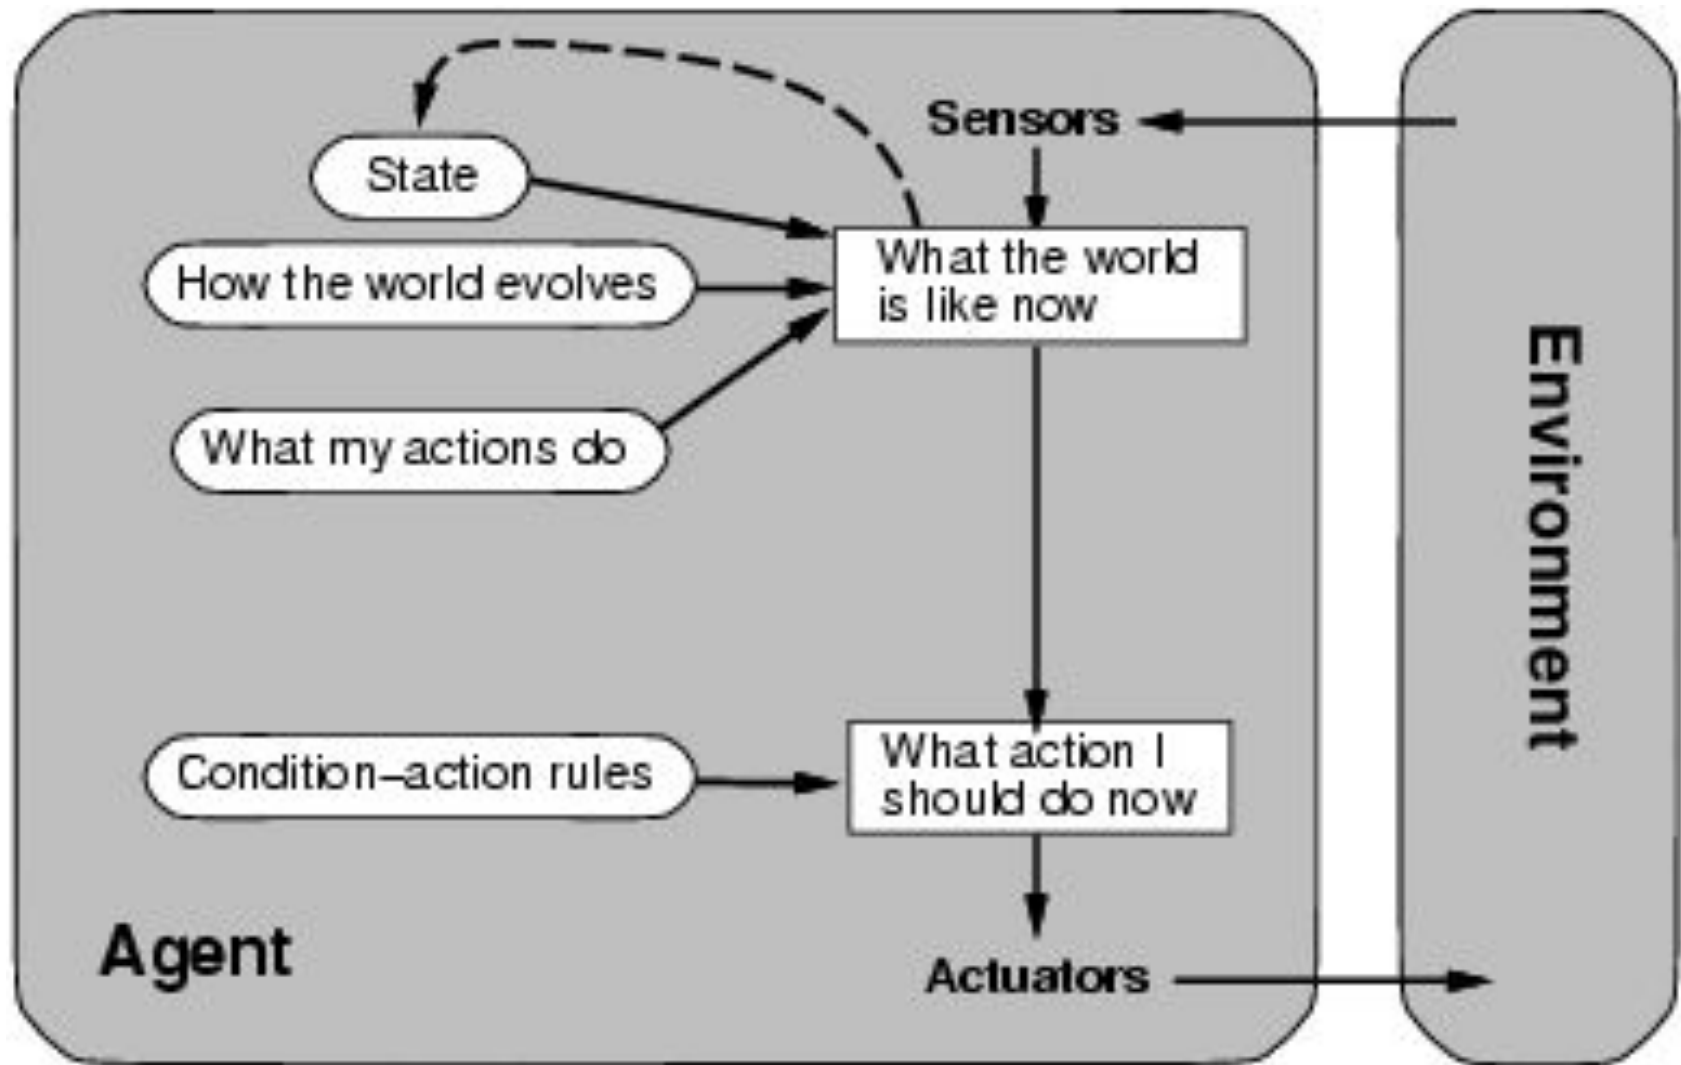

Agent types

- Four basic types in order of increasing generality:
 - Simple reflex agents
 - Model-based reflex agents
 - Goal-based agents
 - Utility-based agents

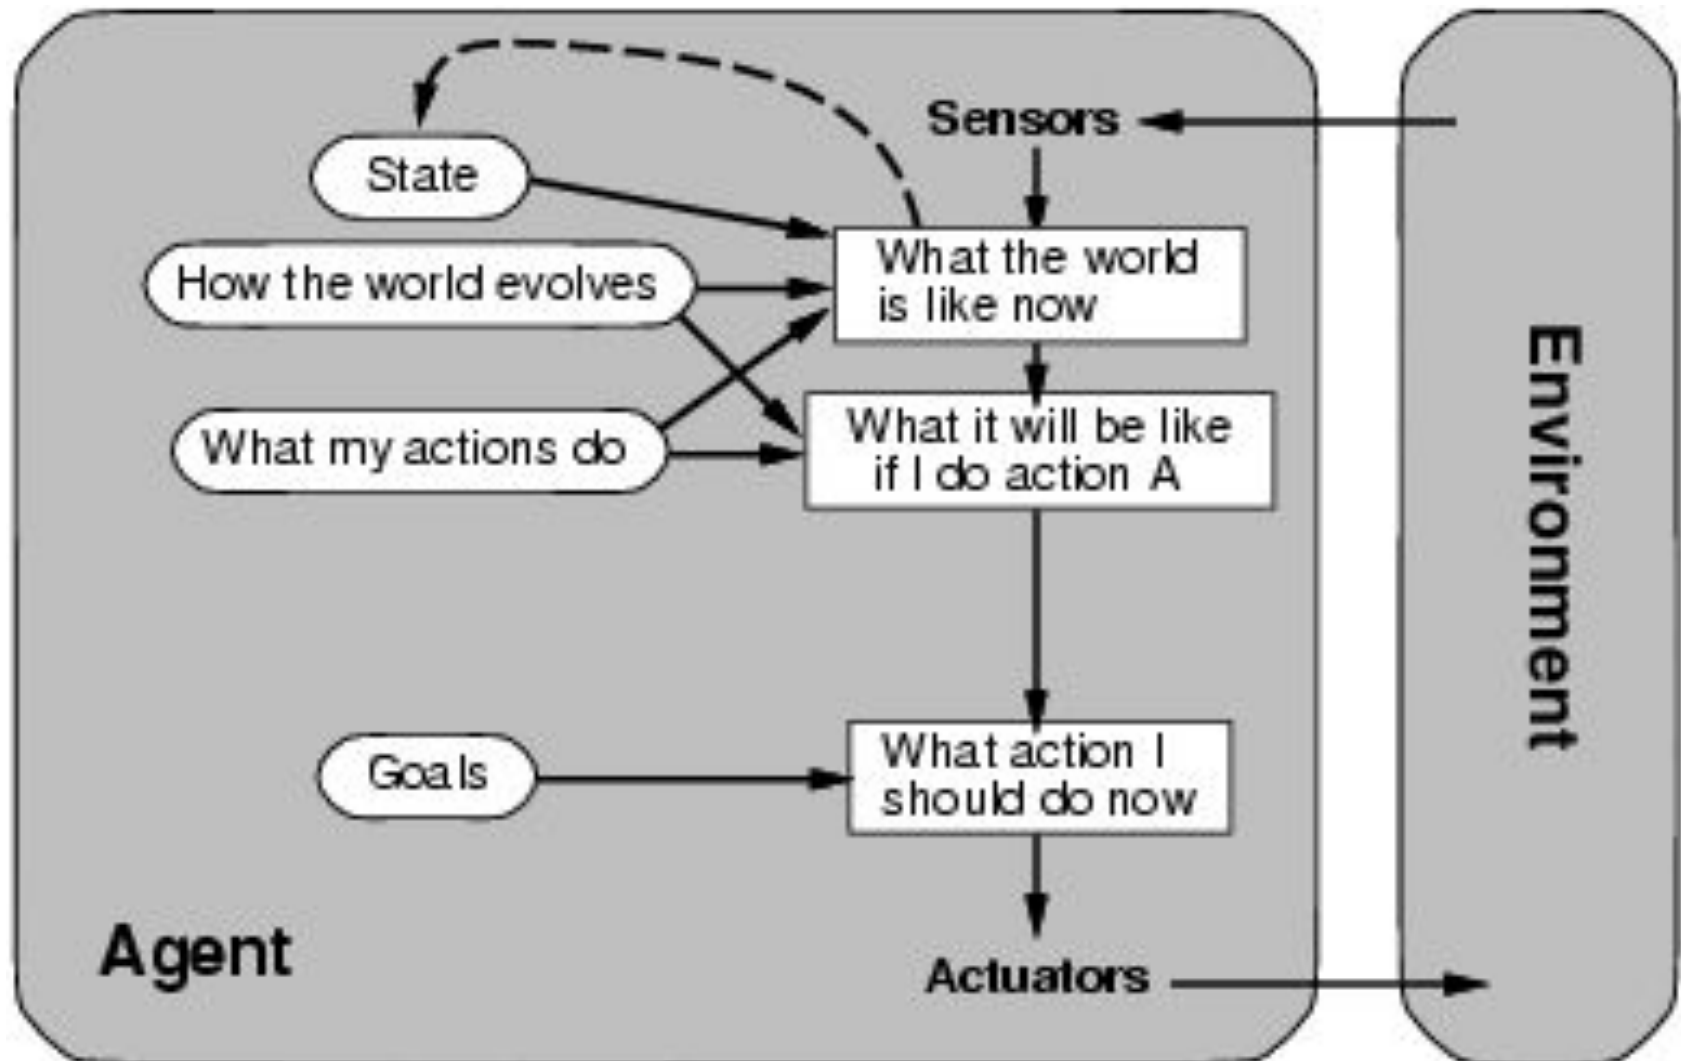

Simple reflex agents

Model-based reflex agents

Goal-based agents

Utility-based agents
